Myocarditis deception
Teenage Boys More Likely to Suffer Heart Inflammation From Vaccines Than COVID-19 Hospitalization: Study

The two main COVID-19 vaccines used in the United States are more likely to land teenage boys in the hospital than COVID-19 itself, a new study has found.
DEFINITIONS

For the vaccine
Reporting rate: VAERS count
Case count = Reporting rate * 41

Baseline
Expected: Actual rate
1 in 318 boys (16-17) will get myocarditis from the Pfizer vaccine
(normally 1 in 7,142 in a year so elevated by 1,144X)

Note: 1,144X is the ratio of 1 in 371K in a week base rate vs. 1 in 318

Note:
Two dose calc: 1000000/((5.2+71.5)*41)=318 (note 41 is the URF)

multiply B/C by 5 since C is 5yr
multiply B/C by 4 since B is under-reported by 4X this year vs. previous years
NOTE: Limited to 20 to 60 age range in US (excludes foreign)
Need to multiply the COVID numbers by 41 to get true incidence rate
But that’s not all…
May 22: “A few young vaccine recipients”

615 in April
1,025 in May

That’s not a few.
And 5 year rate for that age range = 0
And what about troponin?

Did they ever measure it post-vaccine? Nope.
CDC says vaccine-induced heart damage is “mild.” The troponin numbers show they are lying.

(These post-vax levels can be sustained for months and are absurdly high; there is no precedent for this)

SO NOW YOU KNOW...

Why nobody wants to debate us

Why I am no longer “chosen” to speak at FDA/CDC public hearings anymore
(they choose people who bash me)
